

(1A) HTML Basics

Systems and Web Development Workshop
2025 Spring

Dr. Jefferson Fong

Lecture and Lab this week

These slides are written as a **tutorial** for you to follow and learn.

- In the **lecture**, we give you an **overview** of the topics.
 - To understand the material, you need to **go through** the **examples** on **your computer** **after the class** and **in the lab**.
 - Listening to the lecture is not enough.
 - If you don't understand an example, run it on your computer. Change the example a little to see how the results change; **learn by experiments**.
- In the **lab**, you should follow the instructions in these slides **on the computer** to
 - Learn the material
 - Do the exercises

Lecture and Lab this week

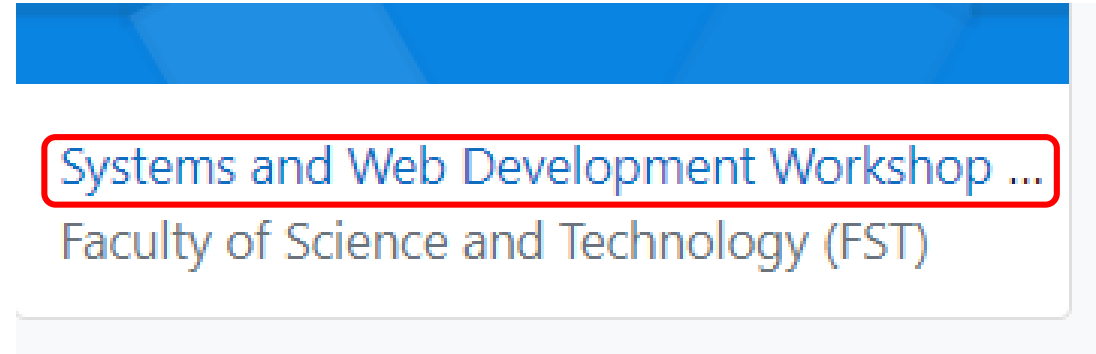

- If you have a tablet or small laptop, you should bring it to class.
- In **lecture**, you can try the examples in your computer.
 - Examples are in iSpace's "sample codes" folder and online at W3 Schools.
- In **lab**, you can
 - Read the **instructions** of this PPT in your **tablet/laptop** and **do** the **exercises** in the **lab computer** (if your tablet/laptop is **small**).
 - Or read the **instructions** on the **lab computer** and **do** the **exercises** in your **computer/laptop** (if your tablet/laptop is **big enough**).
 - Submit to iSpace your code from the exercises.

Tips on doing the Class Exercises in lab

- If you do the exercises in a lab computer, bring a USB memory stick to the lab to save your results.
- In the desktop, create a folder name 1A_HTML.
- From iSpace, download the lecture slides and sample codes for this lab; put them in the 1A_HTML folder you've created.
- Follow the instructions from the slides to do the class exercises in lab.
 - After you finished the class exercises and submitted the results to iSpace
 - If you used the lab computer, copy the 1A_HTML folder to your memory stick. When the lab computer is turned off, your files will be deleted there.
 - If you used your computer, save the folder from desktop to something like SWDW\LabExercises\Lab1

What is HTML?

- HTML stands for **HyperText Markup Language**
- Example of **hypertext**:
 - In your iSpace page, “**Systems and Web Development Workshop ...**” is a hypertext, which contains a link to another webpage.
- **Markup language** uses text to describe how a webpage appears in a browser.

What is HTML?

- HTML elements are represented by pairs of tags, describing the different parts of the webpage.

`<title> My Title </title>` `//` describes the title of the webpage

`<html>` is the root element of an HTML page

`<head>` contains meta information about the document

`<title>` specifies a title for the document

`<body>` contains the visible page content

`<h1>` defines a large heading

`<p>` element defines a paragraph

Hyper Text Markup Language (HTML)

```
<!DOCTYPE html>
<html>
<head>
<title>Page Title</title>
</head>
<body>

<h1>My First Heading</h1>
<p>My first paragraph.</p>

</body>
</html>
```

- HTML
 - Is standard mark up language for creating webpages
 - Uses tags < > to represent different parts of a webpage.
- In “mark up”, browser displays the contents according to the tags’ settings.

HTML Tags

<tagname>content goes here...**</tagname>**

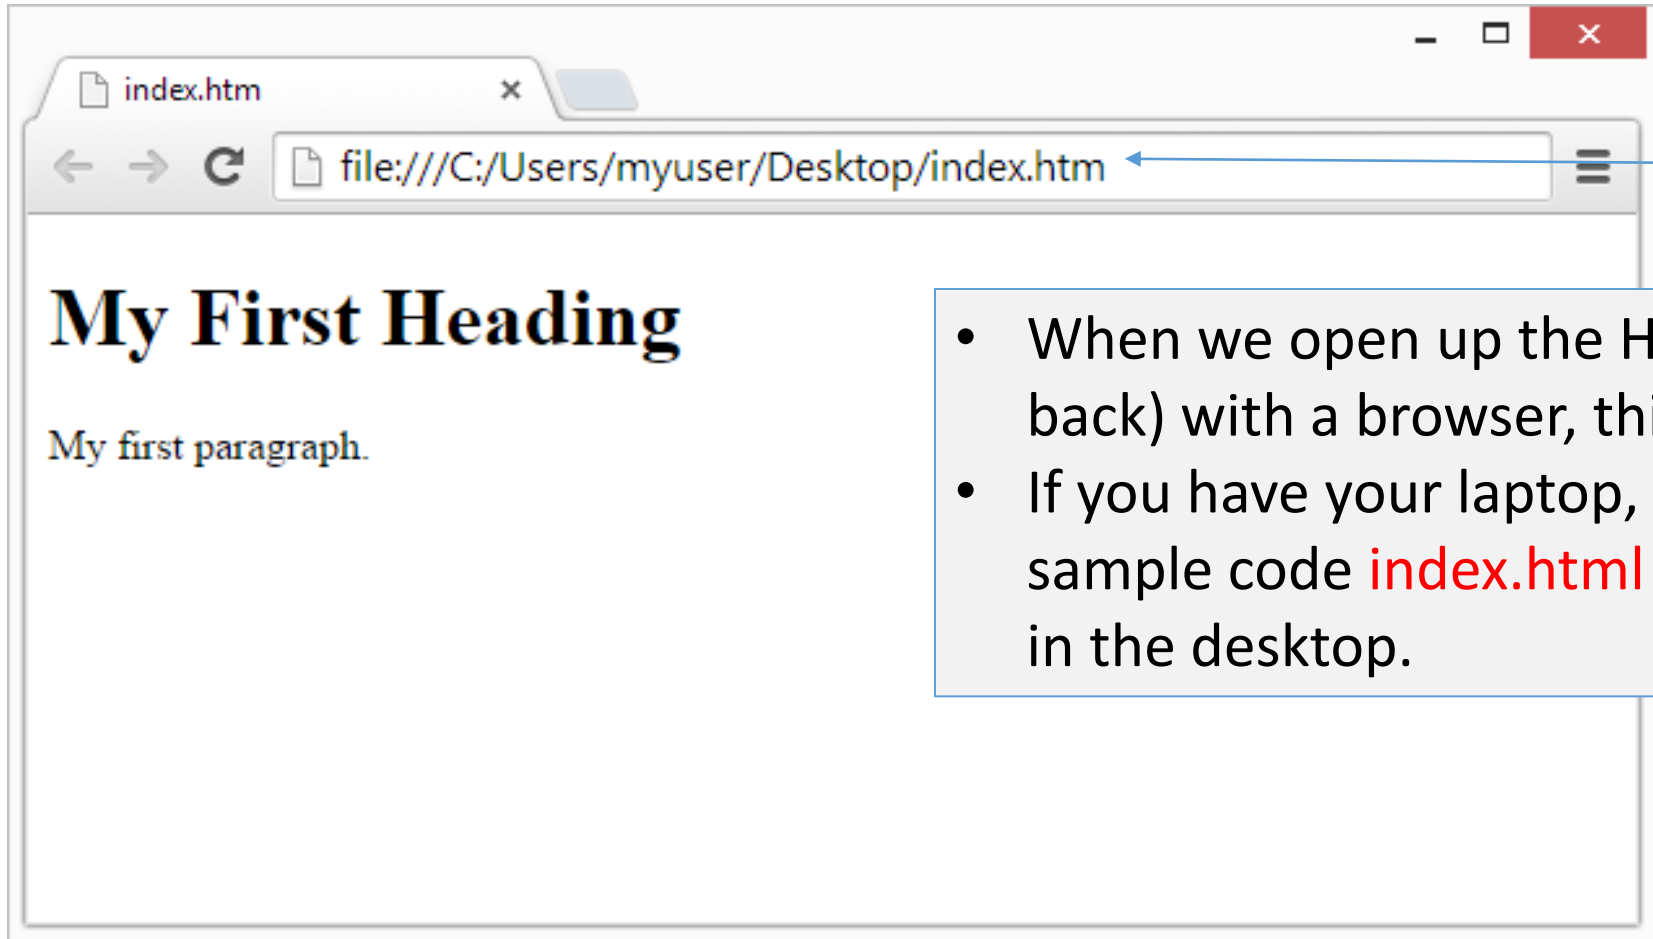

Start tag

End tag
Has a slash /

- HTML tags normally come **in pairs** like <p> and </p>
- The first tag in a pair is the **start tag**, the second tag is the **end tag**

Web Browsers

A screenshot of a web browser window. The address bar shows the file path `file:///C:/Users/myuser/Desktop/index.htm`. The page content includes a heading **My First Heading** and a paragraph *My first paragraph.*. A blue arrow points from a text box to the address bar.

Location of the file

- When we open up the HTML file (in 2 slides back) with a browser, this is what we see.
- If you have your laptop, double click the sample code **index.html** you've downloaded in the desktop.

HTML Editors

Can use Notepad, Notepad++ or **Sublime Text** to create or edit HTML files.

Notepad

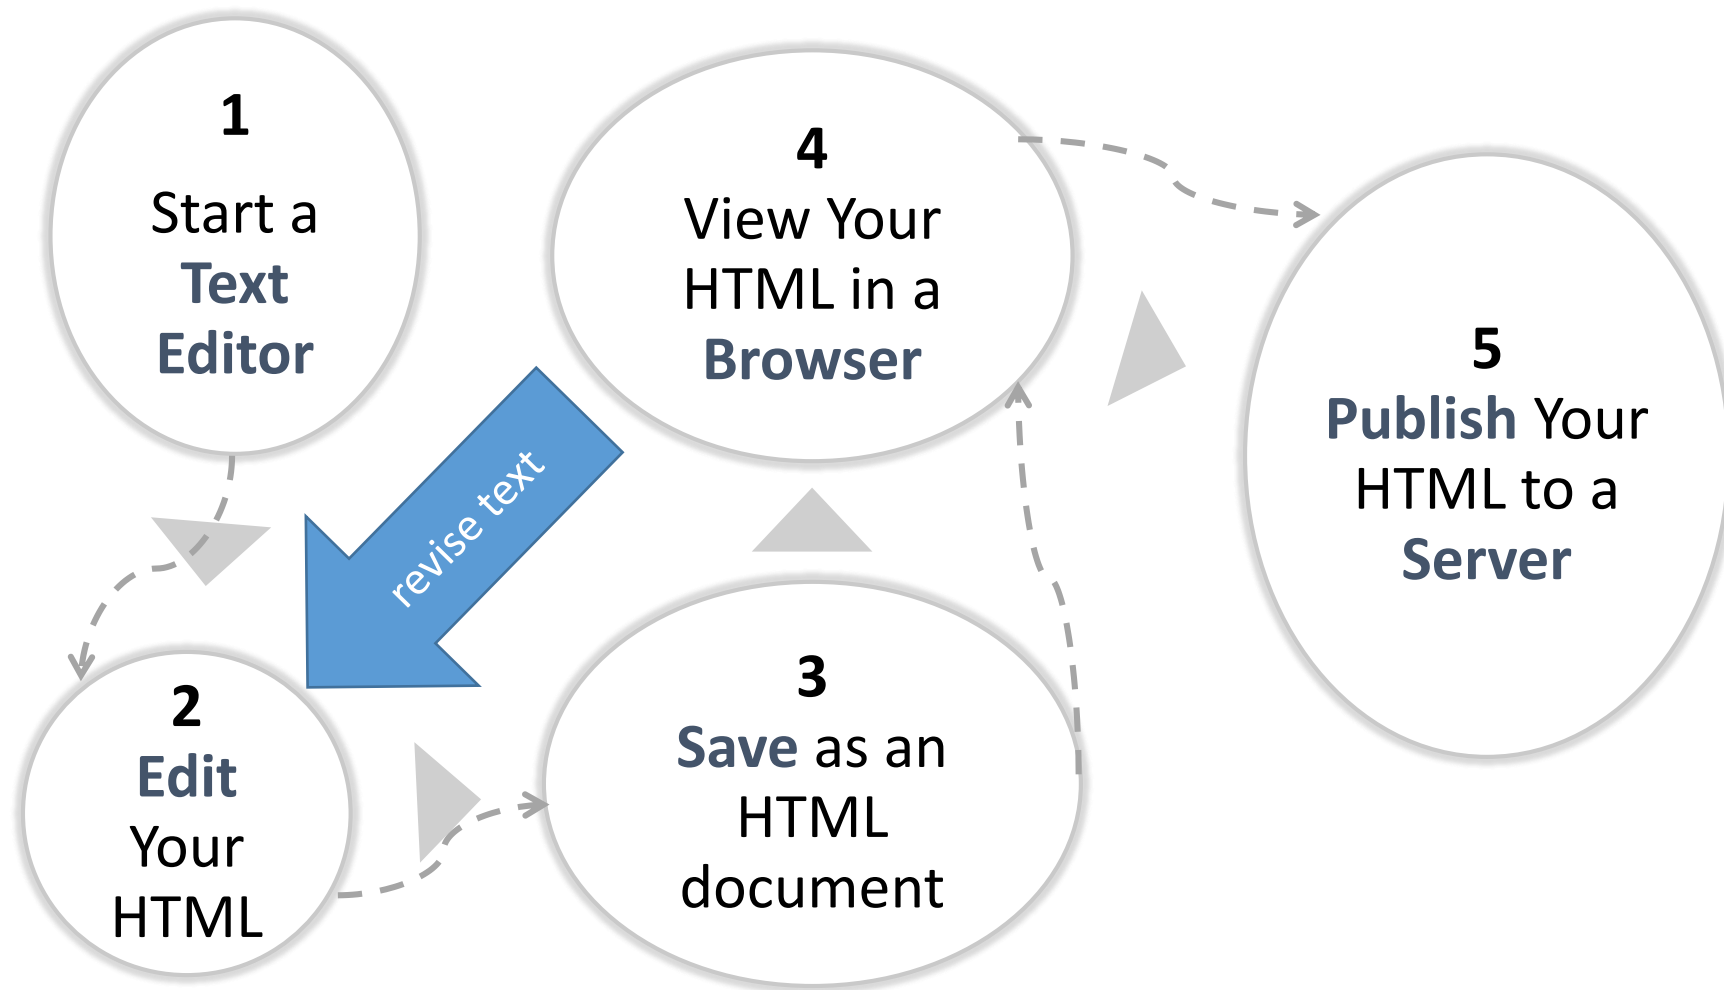

Notepad++

Sublime Text

5 Steps to Create a HTML file

Step 1: A Text Editor

- Notepad
 - Simple but comes with Windows
 - To start, go to

In the Search icon, type in “Notepad” (without the quotes).

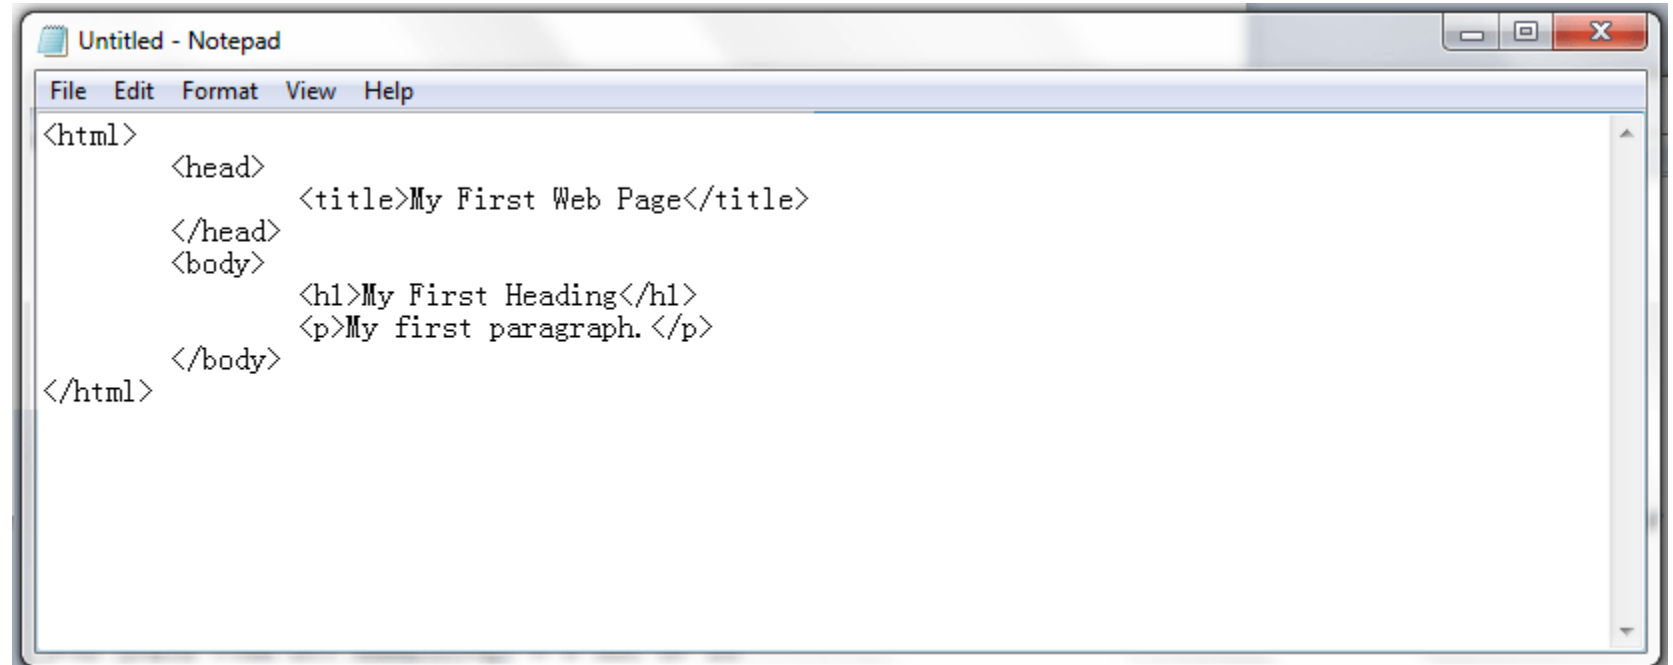

- Notepad++ and Sublime
 - Offers Syntax Highlighting
 - Can download for free

Step 2: Edit

With Notepad

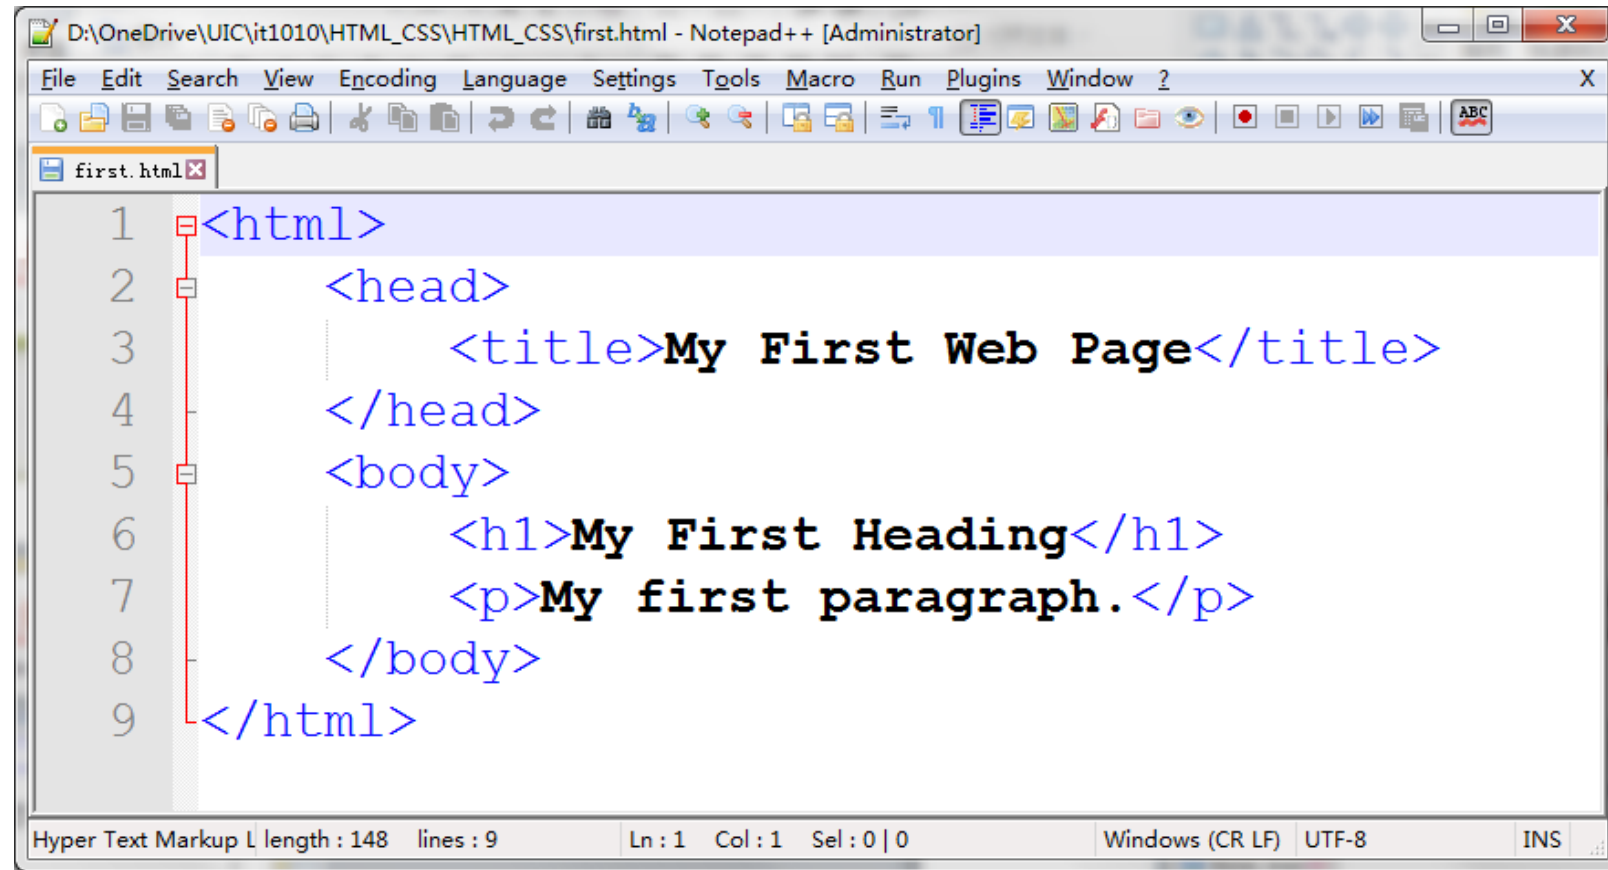

```
File Edit Format View Help
<html>
    <head>
        <title>My First Web Page</title>
    </head>
    <body>
        <h1>My First Heading</h1>
        <p>My first paragraph. </p>
    </body>
</html>
```

- Use the Tab key to indent the tags.
 - You cannot control the number of spaces in the browser output.
 - E.g. in line 2, hit Tab before typing in <head>

Step 2: Edit

- With Notepad++ and Sublime:
- Useful because if the color scheme is wrong, it means you've made a typo.

```
1 <html>
2   <head>
3     <title>My First Web Page</title>
4   </head>
5   <body>
6     <h1>My First Heading</h1>
7     <p>My first paragraph.</p>
8   </body>
9 </html>
```

Hyper Text Markup L length : 148 lines : 9 Ln : 1 Col : 1 Sel : 0 | 0 Windows (CR LF) UTF-8 INS

- Open index.html with Notepad or Sublime.
- Change some of the words outside of the tags.
 - E.g. change “My” to “Jefferson’s” (or whatever your name is).

Step 3: Save

- Select **Save as..** in the file menu.
- Use the **.htm** or the **.html** extension
 - There is no difference, it is entirely up to you.
 - For example: first.html (from the sample code)
- Save the file in the **folder** (e.g. 1A_HTML) you've created on the desktop.

Step 4: View

- Double click the html file.

- Major Web browsers
 - Microsoft IE has been replaced by **Microsoft Edge**.

Step 5: Publish

- Connect to the Web Server via FTP
 - With windows **file explorer**
 - Address

ftp://xxxxxxxxxx@stuweb.uic.edu.cn

ftp – Connect using the file transfer protocol

xxxxxxxxxx - The account (your student ID)

stuweb.uic.edu.hk – Hostname of our HTTP server

The password is the same as your email password

- With **FTP software**

Filezilla

Cyberduck

FireFTP (Firefox Extension)

- Let other people view your html file.
- Do this **next week**, after we set up your accounts on the server.

Step 5: Publish

- Put the file inside the folder **public_html**
 - public_html is the **root** directory of all your Web pages
- View your Web page using a Web browser through the **Internet**
 - Address:
<http://stuweb.uic.edu.hk/xxxxxxxxxx/first.html>

- Let other people view your html file.
- Do this **next week**, after we set up your accounts.

HTML Editors

Use a simple text editor such as
TextEdit, Notepad, Notepad++, or Sublime

- For Notepad++
 - Color helps to separate tags and text
 - Can be set to complete starting by automatically entering closing tags
 - Highlights matching tags
 - Use CTRL + D to duplicate lines/text
 - Can run and select browser from the **menu**
 - Built in FTP
- Sublime has similar features

main.html

```
<!DOCTYPE html>
```

```
<html>
```

```
    <head>
```

```
    </head>
```

```
    <body>
```

```
    </body>
```

```
</html>
```

Let's talk about the various parts of the web page, starting with the most basic.

HTML Headings

- HTML headings are defined with the **<h1>** to **<h6>** tags.

<h1> defines the most important heading. **</h1>**

<h6> defines the least important heading: **</h6>**

HTML Headings

In editor

```
<!DOCTYPE html>
<html>
<body>

<h1>This is heading 1</h1>
<h2>This is heading 2</h2>
<h3>This is heading 3</h3>
<h4>This is heading 4</h4>
<h5>This is heading 5</h5>
<h6>This is heading 6</h6>

</body>
</html>
```

In browser

This is heading 1

This is heading 2

This is heading 3

This is heading 4

This is heading 5

This is heading 6

HTML Headings

- See more explanations and examples in W3 Schools.

On your computer, go to

https://www.w3schools.com/html/html_headings.asp

- Click “Try it Yourself”
- Change the example and check the result.

HTML Headings

< Previous

HTML headings are titles or subtitles that you want to display on a webpage.

Example

Heading 1

Heading 2

Heading 3

Heading 4

Heading 5

Heading 6

Try it Yourself »

HTML paragraphs, links & images

Examples from
W3 Schools.

```
<!DOCTYPE html>  
<html>  
<body>
```

```
<p>This is a paragraph.</p>  
<p>This is another paragraph.</p>
```

```

```

```
<p><a href="https://www.w3schools.com">This is a link</a></p>
```

```
<p>This is a <a href="https://www.w3schools.com">link</a></p>
```

```
<a href="https://www.w3schools.com">  
  
</a>
```

```
</body>  
</html>
```

Text or image serves
another purpose, such as
a link to another page.

This is a paragraph.

This is another paragraph.

This is a link

This is a link

image

- We can insert an image into the page using tag
- These attributes can be used inside of the opening tag:
 - src – where the images is stored
 - alt – alternative text, if the image can't be displayed
 - style – contains css
 - title – shows text on when the mouse is over the image
 - width and height

[This is a link](#)

image and attributes

“Try it Yourself” in

https://www.w3schools.com/html/html_images.asp

In the examples in Image Size – Width and Height

```
<!DOCTYPE html>  
<html>  
<body>
```

```
<a href="https://www.w3schools.com">  
This is a link</a><br/><br/>
```

```
<br/>
```

```

```

```
</body>  
</html>
```

[This is a link](#)

Sample Code

- Download the sample code folder “HTML Samples” from iSpace to your desktop folder.
- Run the sample code **first.html**.
- Notice the link to another page.
- Open first.html with an editor, and see the code for that link, and the image CharlieBrown.jpg.
- Click on the link in the browser.

first.html output in browser

My first heading

Second heading

[this is a link to the other page](#)

Name	Tele
Steve Jobs	123455 987654

first.html code

```
<body>
<h1>My first heading</h1>
<p>Second heading</p>
<a href="./another.html">this is a link to the other page</a>

<br><br>
```

Sample Code

- The browser opens **another.html**.
- Open another.html with an editor.
- Note the link back to first.html.

```
<body>
  <h1>Another heading</h1>
  <p>More heading</p>
  <a href="./first.html">this is a link to the first page</a>
</body>
```

another.html code

another.html output in browser

Another heading

More heading

[this is a link to the first page](#)

- In this example all 3 files (first.html, another.html and CharlieBrown.jpg) are in the **current folder** to the file your clicked. So the link begins with ./

HTML Table

```
<!DOCTYPE html>
<html>
<body>

<table style="width:100%">
  <tr>
    <th>Firstname</th>
    <th>Lastname</th>
    <th>Age</th>
  </tr>
  <tr>
    <td>Jill</td>
    <td>Smith</td>
    <td>50</td>
  </tr>
  <tr>
    <td>Eve</td>
    <td>Jackson</td>
    <td>94</td>
  </tr>
  <tr>
    <td>John</td>
    <td>Doe</td>
    <td>80</td>
  </tr>
</table>

</body>
</html>
```

“Try it Yourself” in

https://www.w3schools.com/html/html_tables.asp

See example for “Table Headers” near the bottom.

Firstname	Lastname	Age
Jill	Smith	50
Eve	Jackson	94
John	Doe	80

- An HTML table is defined with the `<table>` tag.
- Each **table row** is defined with the `<tr>` tag.
- A **table header** is defined with the `<th>` tag.
- By default, table headings are bold and centred.
- A **table data** in a cell is defined with the `<td>` tag.

HTML Table - Cell Spans

```
<body>

<h2>Cell that spans two columns:</h2>
<table style="width:100%">
  <tr>
    <th>Name</th>
    <th colspan="2">Telephone</th>
  </tr>
  <tr>
    <td>Bill Gates</td>
    <td>55577854</td>
    <td>55577855</td>
  </tr>
</table>

</body>
```

Cell that spans two columns:

Name	Telephone	
Bill Gates	55577854	55577855

Border="1" is the default

More in

https://www.w3schools.com/html/html_table_borders.asp

HTML Table - Cell Spans

```
<table style="width:100%">
  <tr>
    <th>Name:</th>
    <td>Bill Gates</td>
  </tr>
  <tr>
    <th rowspan="2">Telephone:</th>
    <td>55577854</td>
  </tr>
  <tr>
    <td>55577855</td>
  </tr>
</table>
```

Cell that spans two rows:

Name:	Bill Gates
Telephone:	55577854
	55577855

See W3 Schools

Resources

- We only teach you some of the features. You need to look up how to do the rest in W3 Schools, “Try it Yourself”.
- W3 Schools
 - w3schools.com/html
 - has more explanations and examples.
 - Can experiment with example codes in that site.
- W3 Schools in Chinese
 - w3schools.cn
 - w3ccoo.com
 - w3school.com.cn
 - Note: w3 school (no s) is a copycat, but it's still useful.

Sample Codes

- Study the sample codes in “HTML samples” folder.
 - Make small changes to the code and see the results in a browser.
 - If you don't understand any part of the code, check the previous slides or look up W3 Schools.
 - Check the code for the small table in first.html.
 - Start with this table, change the table one column or row at a time to make it look more and more like the table in the class exercise.

Site Footer		

- First create the table with place-holders just like this.
- Then fill in the actual content.

- In the small table of the sample code, change from 2 columns to 3 columns.
- Change the headers.
- Then add/change 1 row at a time to the table in this slide.

Class Exercise – Final Solution

<div>1. UIC 2. Bing 3. BiliBili</div>	<div>Charlie Brown</div> <div>My hero</div>	<div><ul style="list-style-type: none">• Fast• Concise• This space for rent</div>
<div>Link1_page Link2_page BiliBili Baidu</div>		
Week 1 HTML basics		

- Create some links (that works), lists, and images.
- Submit the html files and images to iSpace.

Submit your solution to iSpace

- Put all your html and image files for your exercise solution into a folder.
- Zip the folder and submit it to iSpace.
- **Class exercises are due** 24 hours after the lab ends.
